Otopic ONE-PAGE BUSINESS PLAN

As of 6 November 2026
Stage: Phase 1 — internal tool inside Sapilon engagements

The project brain that lives in your cloud — AI-native collaboration for teams and their clients, with sovereignty by design.

● Simple ● AI-native ● Sovereign

1 Problem

- **Work context evaporates** between the board, the thread, the doc and the WhatsApp group.
- **SME teams can't staff the overhead** — real coordination and client-communication load, no one free to write status updates.
- **AI is bolted on**, running over boards and rich-text blobs it parses poorly.
- **Regulated teams are locked out** — legal, healthcare and finance can't put their data in someone else's cloud.

2 Solution

The **Topic**: one durable home for a piece of work — notes, chat, tasks, decisions and AI context. One **agent**, chat or talk, that **finds, does and answers** ("where are we on Acme?"), sees only what the asker may see, and cites its sources. Deployable into the customer's own AWS (BYOC). Build order: chat (find + answer) → do → talk.

3 Why we win

- **Simple + AI-native + sovereign.** No tool has all three; any one is copyable, the combination is the moat.
- **Text-first data model** → accurate, cited answers. Incumbents would have to rebuild their core to match.
- **Our own line, not a replacement:** *"Keep chatting anywhere. Otopic is where your work and its decisions live — and you can ask it anything."*
- **Clients are first-class** — they ask a shared topic themselves, on a free seat.

4 Why now

"Ask your workspace" is table stakes in 2026 (Microsoft 365 Copilot, Slack AI, Atlassian Rovo, Notion AI), so the contest moves to *what* the AI runs over, *where* it runs and *who* can ask. Remote and hybrid work is permanent and async context loss is unsolved. Regulated industries are compliance-blocked, not price-sensitive.

5 Customers

SEGMENT	WHO	MOTION
Primary	SME teams of ~5–50, client-facing services first: agencies, consultancies, studios, professional services	Seeded via Sapilon → Free team trial → Teams
Premium	Regulated & enterprise: legal, healthcare, biotech, finance	Top-down via Sapilon → Enterprise (BYOC)
Later	Freelancers & solo operators	Self-serve on Free; no spend, no roadmap pull

6 Operations & funding

One offer, two revenue streams: **Sapilon services + Otopic recurring**. Shared tech core, one content engine, and every engagement ships a customized sovereign Otopic instance — a Sapilon revenue line *and* an Otopic logo. R&D is funded by a revenue-percentage rule with ring-fenced engineering hours; separate funding and team are a Phase 3 question. Customizations never fork core; a feature joins core only when **3+ clients** ask for it independently.

7 Business model — four tiers, two motions

TIER	PRICE	FOR	INCLUDES
Free	€0	Team trials, client-side stakeholders, individuals	All core features; no AI beyond a one-time €1–3 trial credit per user
Standard	€10–15 / mo	One person	AI included
Teams	€10–15 / user / mo	SME teams	Team AI, multiple workspaces, client-branded views, priority support
Enterprise	PAYG	Regulated, enterprise	AWS + AI + subscription (+ labor); BYOC in the client's AWS org, SLA, dedicated onboarding

Conversion is built in: the trial credit runs out → Standard or Teams; a second person joins → Teams; Enterprise enters through Sapilon engagements. Only agent *answers* draw on AI — search and simple commands are free on every tier. Client-side seats are never billed.
Illustrative: a 20-seat Teams account ≈ €2.4–3.6k ARR.

8 Go-to-market

Phase 1 mid-2026 → early 2027	**Internal tool** WE ARE HERE — inside every Sapilon engagement, no public marketing; goal **5–10 reference clients**, funded by services.
Phase 2 2027 → mid-2028	**Standalone product** — public launch of Free / Standard / Teams; Enterprise packaged through Sapilon; content on AI + project execution feeds both funnels.
Phase 3 mid-2028+	**Decision point** — spin out as an independent company or stay Sapilon's flagship. Architecture and brand stay spin-out-ready.

Growth loop: every project invites client-side stakeholders for free → they experience Otopic as "how this firm works" → they bring it into their own organizations.

9 Top risks & mitigations

RISK	MITIGATION
Sapilon emergencies eat Otopic dev time	Ring-fenced hours + revenue-percentage R&D rule
Heavy AI users turn margin-negative	Only answers count; fair-use limit; measure AI cost per active user before fixing prices
Agent leaks across a sharing boundary	Answers scoped to what the asker can see, tested before launch, always cited
"Ask your workspace" is commoditized	Compete on cited answers over text-first topics, AI in the customer's cloud, clients asking topics
BYOC operational complexity	Deployment automation (Terraform/CDK) before scaling Enterprise
One client warps the core	Isolated customization layer + 3-client promotion rubric

10 Phase 1 must prove (by early 2027)

5–10 reference clients
Live on Otopic through Sapilon engagements.

AI unit cost
Per active user and per answer — sets the Standard / Teams prices and the fair-use limit.

Trial-credit behavior
Share of Free users who spend it, and conversion after it runs out.

How the agent is used
Answers vs. commands, and talk-mode retention.

Still open: exact price points (does a Teams seat sit above Standard?) · trial-credit size · Enterprise PAYG composition · market size — not yet quantified.
